To Whom It May Concern:

I am writing this letter as a professional recommendation for Maxwell Fleming. I was his direct supervisor at One More Game, where he worked on our analytics team from March 2026 until the company shut down in August. Max joined us part-time while working towards his degree at Whitman College.

At One More Game we built and shipped SWAPMEAT - a multiplayer roguelite shooter on Steam. Max led our new-player and retention analysis. We asked him to help us understand how players were engaging with the early parts of the game, where they were making progress, and where they were quitting. He produced findings across many areas of gameplay, and those findings led directly to changes we made to the structure of runs shortly before we shipped. His analysis gave us the confidence to change both the length of a run and the point at which a player returned to the lobby to swap equipment. Both changes had a measurable, positive impact on engagement in the launched game compared to our Early Access versions.

Initially, Max's work reached us as written analysis. He would take a question, work through the data, and come back with findings and recommendations written in well-structured external documents. Max always took the time to promote his work and follow up on his analysis with the team in Slack threads and video calls.

Without any prompting from me, Max decided the new-player data was important enough to warrant becoming a dashboard that updated nightly. He took it upon himself to build that dashboard and deploy it on the existing analytics infrastructure we had created for other reporting efforts. I did little more than point him at existing examples when he ran into problems; he got it running on his own. The dashboard covered over a dozen metrics, including our tutorial funnel, playtime and run counts, win/loss analysis, difficulty distribution, progression, platform spread, and multiplayer versus single-player behavior. It looked great, had clear actionable data, and greatly improved the visibility of his work to the rest of the team.

Post-launch, Max moved from pure analysis into a production analytics codebase. He contributed calibration and forecasting queries for our live community challenges, so we could set goals that players could actually achieve. He even defined and published metrics into the public data API that backed playswapmeat.com's display of progress towards those challenges for players.

Max was genuinely great to work with. He accepted feedback graciously and was always willing to go back and turn the crank one more time, refining numbers or pulling additional detail out of an analysis. He would be a fantastic hire and addition to any team. I am glad to speak with anyone who would like more detail.

Sincerely,

Jared Chavez
